

# Incident Investigation

Incident investigation provides a rich source of data to promote change or sustain good practice in your organisation. When incident information is well understood, it serves to shine a light on issues that were previously unknown and helps you and your people address health, safety and wellbeing areas quickly and adjust your approach.

This approach can save lives, so the quality of incident investigation and the ability of the investigator to turn data into insights are important components in your organisation's health, safety and wellbeing toolkit.

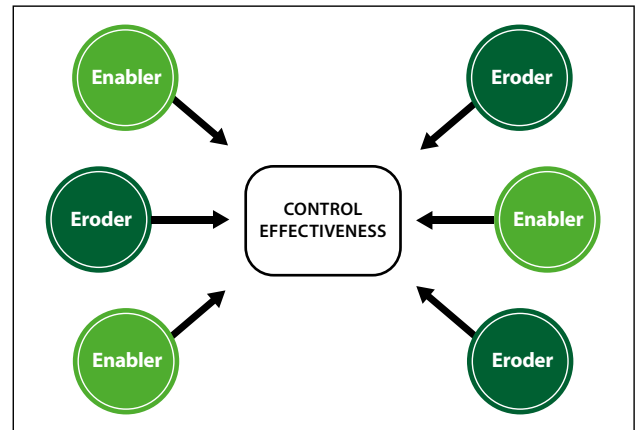

**Learning from incidents to prevent recurrence is pivotal to good risk management.**

When incident investigations are thorough and robust and the organisation genuinely seeks to understand why an incident occurred, learnings are deeper and risk management is enabled. Exploring the leadership, culture, behaviour and systems that contributed to ineffective risk control is key to becoming a learning organisation.

With experience across all industries and supporting over 120 different organisations around the world, HSE Global have investigated many high-profile safety incidents and our consultants have the experience to run comprehensive investigations that identify why incidents occurred and recommend meaningful and practical corrective actions.

Explore contributors to ineffective risk control:

*Thanks HSE Global... your ability to build relationships and trust in a short period of time helped us find the truth and identify ways to stop incidents from happening again.*
